

Getting fastened up!

Peter is an example of many people who have the use of only one arm due to a stroke, an amputation, or other cause.

One of the frustrating consequences is the difficulty in doing up the zips on jackets and cardigans and similar clothing.

The solution shown here is simple but effective. It consists of a strong clip (of the type often used on clothing hangers) to which is attached about a meter of string.

The clip is attached close to the zip at the bottom on the non-slider side. Placing a foot on the string then holds this side down. The slider can then be slid on and pulled up with the functioning hand.

The string can easily be folded up and the aid kept in a pocket for convenient future use.
